

Photography

The invention of photography in 1839 had a huge impact on art, changing artists' ideas and approaches forever. At first, many thought it would make painting redundant. Then, some artists began using the technology to help them. In the 1870s, US-based English photographer, Eadweard Muybridge (1830–1904) used several cameras and relatively fast shutter speeds, to study horses and humans in motion. Capturing the details of such movements helped artists to represent them accurately.

After a difficult start, painters began to use photography as a tool, often in preparation for paintings. Some photographers, such as Julia Margaret Cameron (1815–79) and Alfred Stieglitz (1864–1946) helped to turn the medium itself into an art form. Photography also gave artists fresh ideas: Gustave Courbet (1819–77), Gérôme and Degas used it extensively to assist their observation of details and create interesting compositions. For instance, photographs allowed Degas to create unusual viewpoints and 'cut off' elements at the edges.
