Both British and continental philosophy became increasingly concerned with language as the 20th century progressed. Analytic philosophy called for the analysis of philosophical statements to render them in a logical form, prompting an interest in the philosophy of language itself, while in France the tradition of literary philosophy spawned structuralism, a philosophy based on linguistic structure. This trend was mirrored in the growth of linguistics itself. The aim of this young science was to study language using scientific methods, but there was also some cross-fertilization with linguistic philosophy. Among other things, linguistics is concerned with the structure of language, in terms of its grammar, semantics and so on, and this

influenced the structuralist movement. It also studies the way that languages have evolved, how they differ from one another and whether there is an underlying structure common to all languages. This, too, has philosophical implications, in particular in the study of the way that we acquire language and use it to express our ideas.
